1.0 INTRODUCTION

1.1 INTRODUCTION AND PURPOSE

This drainage study provides analysis to establish runoff discharge rates for Line L00P01, a significant storm drain collection system in the center of the City of Dana Point, and to determine if the Line L00P01 storm drain has available hydraulic capacity to continue to receive and convey runoff from tributary areas originating within the Orange County Dana Point Harbor project boundary (Harbor). The Harbor is currently planning major renovations within its commercial core area south of Dana Point Harbor Drive (formerly Del Obispo Street), west of Puerto Place, and east of Casitas Place. Land use characteristics of the renovation will be similar to those in the existing condition. Line L00P01 originates approximately one mile upstream of the Harbor and captures 234 acres of tributary within the City of Dana Point before entering the Harbor, capturing an additional 4.5 acres of Harbor tributary and outletting through a sea wall into the Dana Point Harbor marina. Refer to Figure 1 for the alignment and tributary boundary of Line L00P01. The portion of Line L00P01 storm drain which resides within the harbor was constructed circa 1968 when the original harbor construction was undertaken and has historically received and conveyed runoff from tributaries within the Harbor project limits. With the planned renovations, the Harbor will continue to send runoff to the existing L00P01 storm drain.

1.2 BACKGROUND

The Line L00P01 storm drain was originally constructed circa 1968 as part of the original Dana Point Harbor grading and infrastructure construction and extended 900-feet between its sea wall outlet into the Dana Point Harbor marina and Dana Point Harbor Drive (formerly Del Obispo Street). The storm drain is a 60″ RCP through the Harbor except for a short 25-foot transition to an RC Box at the sea wall outlet. Line L00P01 storm drain originally terminated just north of Dana Point Harbor Drive as a basin impoundment created by the fill construction for Dana Point Harbor Drive (see Exhibit 1 in Appendix A). At the time of construction, areas upstream of the basin impoundment between Dana Point Harbor Drive and Pacific Coast Highway were open space and areas north of Pacific Coast Highway were moderately populated. Research for this report did not produce a hydrology report for the original harbor grading and infrastructure construction and discharge values or a hydraulic grade line does not appear on the as-built drawings.

On-site improvements were made in the Harbor soon after the original grading and infrastructure improvements (including the 60″ RCP) were completed. On-site improvements in the vicinity of Line L00P01 included building structures housing retail space and Harbor services as well as paved parking lots. Research for this report did not produce as-built drawings for the on-site Harbor improvements. However, because surface evidence indicates inlet locations in the parking lot near the alignment of the 60″ RCP, camera probe work was performed to determine if the inlets connect to Line L00P01. The results of the camera probe work indicate five inlets and three connection pipes join the 60″ RCP storm drain and drain an on-site

tributary of 4.5 acres. The inlets, connector pipes, and their respective tributary areas are shown on Figure 2. It should be noted that the City of Dana Point Master Plan of Drainage (refer to Appendix A-Exhibit 2-Sheet 8) does not indicate the presence of on-site Harbor tributary connections to Line L00P01, and the City of Dana Point Storm Drain Atlas (refer to Appendix A-Exhibit 3-Sheet D9) indicates the presence of two inlets and one connector pipe connection to Line L00P01.

Between the mid 1970's and late 1980's areas to the north of the Harbor were built out and Line L00P01 was extended north from Dana Point Harbor Drive to Selva Road capturing 100 percent of the present day hydrologic boundary. Refer to Appendix A-Exhibits 4 and 5 for Line L00P01 mainline extension as-built drawings. This off-site tributary (upstream of the Harbor) covers 233.6 acres and mainline L00P01 pipe sizes range between 33-inches and 66-inches. Hydrologic information for off-site L00P01 was unavailable although hydraulic data tables presented on Exhibit 4 indicate the segment of L00P01 between Dana Point Harbor Drive and Pacific Coast Highway was originally designed to convey a 10-year storm event.

2.0 HYDROLOGIC ASSESSMENT

2.1 ANALYSIS FRAMEWORK

A hydrologic analysis has been prepared for Line L00P01 existing and proposed conditions utilizing the methodology described in the Orange County Hydrology Manual, October, 1986 (Hydrology Manual) and methods accepted by the Orange County Public Works/Flood Division. Three separate models have been prepared for the two conditions (existing and proposed). Model 1 studies existing condition runoff and assumes no inclusion of tributary from Dana Point Harbor on-site areas (consistent with the City of Dana Point Master Plan of Drainage document, Appendix A-Exhibit 2). Model 2 also studies existing condition runoff but provides for 4.5 acres of Harbor on-site tributary area contributing to the system. This model is the baseline condition model. Model 3 studies proposed condition runoff and assumes no changes to development conditions north of Dana Point Harbor Drive while providing for planned Dana Point Harbor on-site renovation conditions. Proposed condition modeling was based on the Orange County Harbor Revitalization site plan shown on Figure 3. The analysis used in this study is based on the storm frequency of a ten-year high confidence event as specified in the Orange County Local Drainage Manual.

2.2 METHODOLOGY

The hydrologic study limits consist of an area entirely within the incorporated City limits of Dana Point and encompasses a range of tributary acreage between 233.6 acres and 238.1 acres depending on the model. Watershed drainage areas and drainage patterns were defined based upon a review of the City of Dana Point Master Plan of Drainage document and Storm Drain Atlas document, electronic contour mapping obtained from Intermap Technologies, Inc., an on-line vendor, and a field reconnaissance survey. A comprehensive inventory of existing drainage facilities was prepared through a review of record drawings from the City of Dana Point and the County of Orange. A proposed storm drain facility planned for the "Town Center Pacific Coast Highway and Del Prado Streetscape Improvement Project" was also integrated into the models. This storm drain will replace an existing facility which currently traverses private property east of Street of the Golden Lantern and north and south of Pacific Coast Highway. Surface flow conveyance data was derived by takeoff from the electronic contour mapping. Pipe flow conveyance data was taken directly from storm drain as-built drawings for Line L00P01 (see Appendix A-Exhibits 4 and 5). Data on land use was taken from a review of the City of Dana Point Land Use Map, November, 1993 and Zoning Map June, 2008 (refer to Appendix A-Exhibits 6 and 7). Where the two documents were in conflict or were non-specific, a review of aerial photography was utilized to determine the land use. Figure 4, Existing Land Use Map, summarizes the existing land use factors used in the hydrologic models. Land use factors used in the proposed condition model were identical to the existing condition, including the use of a "commercial" factor for all on-site areas in the Harbor south of Dana Point Harbor Drive. Soil Type D conforming to the soil classifications published in the Hydrology Manual were used throughout the watershed. Soil Type D is the most conservative of the four soil groups listed in the Hydrology Manual and has high runoff potential characteristics (slow infiltration rates).

The rational hydrologic method, conforming to the 1986 Orange County Hydrology Manual, was used in this study investigation. This method and the data and criteria it incorporates, is consistent with accepted methods of analyzing storm water runoff in Orange County. The rational method is used when drainage areas are less than 640 acres (one square mile). The rational method relates rainfall intensity, the ratio of runoff to rainfall expressed as a runoff coefficient, and the drainage area size to the peak runoff. Rational method hydrologic computations were made using computer analysis techniques of the RATSCx program by Advanced Engineering Software, Version 19.0, June, 2012.

2.3 HYDROLOGIC RESULTS

Watershed hydrology calculations for a 10-year high confidence storm event have been prepared for two existing condition models and one proposed condition model utilizing the methodologies and variables described in Sections 2.1 and 2.2. All three models have identical watershed characteristic upstream of hydrologic Node 191 located at the intersection of Dana Point Harbor Drive and Street of the Golden Lantern and variable watershed characteristics downstream of Node 191. Refer to the study hydrology maps for significant hydrologic model locations in the watershed. Existing condition (w/o Harbor) hydrology calculations and hydrology maps can be found in Appendices B.1 and C.1, respectively. Existing condition (w/Harbor) hydrology calculations and hydrology maps can be found in Appendices B.2 and C.2, respectively. Proposed condition (w/Harbor) hydrology calculations and hydrology maps can be found in Appendices B.3 and C.3, respectively. Table 2.1 summarizes the hydrologic results at Nodes 191 and 214 (Dana Point Harbor Marina)for all three models.

Table 2.1: Watershed Hydrologic Summary

Model No.	Model Description	Tributary Area at Node 191[(1)] (acres)	Discharge at Node 191 (cfs)	Tributary Area at Node 214[(2)] (acres)	Discharge at Node 214 (cfs)

3.0 HYDRAULIC ASSESSMENT

3.1 ANALYSIS FRAMEWORK AND METHODOLOGY

Hydraulic modeling analysis has been performed for a portion of Line L00P01 storm drain mainline to determine the hydraulic grade line (HGL) of the system and to determine the sensitivity of Dana Point Harbor on-site tributary runoff inclusion on the system HGL. Line L00P01 traverses 6,850-feet between its origin at the Golden Lantern/Selva Road intersection and its outlet into Dana Point Harbor marina, however, the hydraulic modeling does not extend north of Pacific Coast Highway because the hydraulic flow regime in the pipe system between Dana Point Harbor Drive and Del Prado is supercritical and backwater effects from the downstream system are absent. Three hydraulic models were prepared for the three conditions described in Chapter 2, including existing condition 10-year event without Harbor tributary inclusion (Model 1), existing condition 10-year event with Harbor tributary inclusion (Model 2), and proposed condition 10-year event with Harbor tributary inclusion (Model 3). 10-year event discharges utilized in the hydraulic modeling were taken from the hydrologic results presented in Chapter 2. Hydraulic modeling analysis was performed utilizing the Water Surface Pressure Gradient (WSPG) computer modeling software Version 14.06 from Civil Design Corporation, originally the Los Angeles County Flood Control District program FO515P. Storm drain system stationing, invert elevations, and conduit sizes were taken directly from as-built drawings of the existing L00P01 system (see Appendix A-Exhibits 1 and 4). Because station and vertical datum control were different between the two sets of as-built plans, stations and inverts were converted on the Dana Point Harbor drainage plan (Exhibit 1) to agree with the L00P01 drainage plan (Exhibit 4). Conversion data can be seen on Figures 5a, 5b, and 5c. Hydraulic models 1, 2, and 3 can be found in Appendices D1, D2, and D3 respectively.

3.2 HYDRAULIC RESULTS

Hydraulic grade line results from the three WSPG models described in Section 3.2 are summarized in Tables 3.1, 3.2, and 3.3 respectively.

[1] Refer to Exhibits 1 and 4 in Appendix A.

The analysis results identify several key items;

- Except for a short segment of open channel flow between stations 2+35 and 2+85, flow passing through the Harbor is under pressure in all three model scenarios.

- Although pressure flow is prevalent in Line L00P01 as it passes through the Harbor, the hydraulic grade line stays below ground and provides freeboard under all three model conditions.

- The mainline junction structure at station 10+54 located at the intersection of Golden Lantern and Dana Point Harbor Drive receives substantial lateral flow from tributaries to the west. The flow regime is pressurized and the hydraulic grade line is near or above finished surface at this location under all three model conditions.

- A significant grade break in the pipe invert occurs at station 11+00 transitioning from a steep invert gradient upstream of the location to a flat invert gradient downstream of the location. This grade break causes a hydraulic jump in the hydraulic grade line generally around station 12+00 in all three models. Downstream of the hydraulic jump, flow in the pipe system becomes pressurized and the hydraulic grade line is above ground at station 11+00.66 likely creating on outflow condition during a ten-year peak flow storm even at the catch basin on the west side of Golden Lantern just north of the intersection. The contribution of runoff to the system from Dana Point Harbor on-site tributaries does not change this condition in any of the models.

- An open channel flow regime with supercritical flow is present upstream of the hydraulic jump (upstream of station 12+00) in all three models.

3.3 CONCLUSIONS

The Orange County Dana Point Harbor Revitalization Project is planning renovations to the harbor's commercial core area south of Dana Point Harbor Drive, east of Casitas Place, and west of Puerto Place in the City of Dana Point. The Harbor was originally constructed in the late 1960's and early 1970's and included a 60" RCP storm drain conduit to drain off-site areas upstream of the Harbor and to drain portions of the commercial core area in the Harbor. The conduit (Line L00P01) outlets into the Dana Point Harbor marina and was originally constructed 835-feet north to a terminus just north of Dana Point Harbor Drive (formerly Del Obispo Street). Between the mid-1970's and late 1980's, Line L00P01 was extended northerly in phases to its terminus at the intersection of Selva Road and Street of The Golden Lantern. Drainage planning for the Harbor Revitalization Project allows for Line L00P01 to continue receiving runoff from up to 4.5 acres of tributary area from the on-site Harbor watershed which is consistent with historical drainage usage patterns. Due to the absence of reliable hydrologic and hydraulic information for Line L00P01, analysis has been prepared and presented in this report to confirm that the continued flow of Harbor tributary to Line L00P01 will not have an adverse effect to the hydraulic performance of the pipe system. Results presented throughout the report lead to the following conclusions:

- Runoff from 4.5 acres of on-site Harbor tributary watershed has historically flowed into and been conveyed to the marina outlet by the Line L00P01 storm drain system.

- The City of Dana Point Master Plan of Drainage Document (Appendix A-Exhibit 2) has omitted the 4.5 acre Harbor watershed from inclusion into Line L00P01's overall tributary watershed.

- Model 1 results presented in this report do not represent the current hydrologic and hydraulic condition of the storm drain system because the model does not include runoff from the 4.5 acres of Harbor tributary.

- With the inclusion of 10-year storm event runoff from up to 4.5 acres of Harbor tributary, the hydraulic grade line of Line L00P01 remains below finished ground through the Harbor area and provides freeboard in existing (Model 2) and proposed (Model 3) modeling conditions.

- Existing condition (Model 2) hydraulic modeling results indicate runoff from a 10-year peak flow storm event will be purged from a catch basin inlet on the Street of The Golden Lantern just north of the intersection with Dana Point Harbor Drive (around storm drain station 11+00). Proposed condition (Model 3) hydraulic modeling results indicate this condition will not be changed and the inclusion of on-site Harbor runoff into the system will not otherwise adversely affect the L00P01 storm drain system.

Results and conclusions stated above and throughout this analysis and report confirm that storm flow runoff from up to 4.5 acres of Harbor tributary watershed can be conveyed through the Harbor by Line L00P01 without any adverse effect to the hydraulic grade line.

STORM DRAIN GENERAL NOTES

1. STATIONS SHOWN ON THE STORM DRAIN PLANS ARE ALONG THE CENTERLINE OF CONDUIT OR ON A LINE NORMAL TO THE CENTERLINE OF THE CONDUIT.
2. MANHOLES SHALL BE CONSTRUCTED ACCORDING TO ORANGE COUNTY HIGHWAY DEPARTMENT STANDARD PLATE NOS. 308, 305, 307, AND 310 WHERE THE STORM DRAIN CONDUIT IS 54" OR SMALLER. FOR LARGER SIZE CONDUIT, MANHOLES SHALL BE CONSTRUCTED ACCORDING TO DETAIL.
3. WHERE REINFORCED CONCRETE PIPE HAS A DEFLECTION OF GREATER THAN 5° USE CONCRETE COLLAR PER DETAIL.

JUNCTION STRUCTURE NOTES

1. BREAKOUT LIMITS SHALL BE DETERMINED AS FOLLOWS: UPSTREAM LIMIT - AT THE INTERSECTION OF THE OUTSIDE OF THE SPUR WALL WITH THE MAIN LINE PIPE WALL. DOWNSTREAM LIMIT - 6 INCHES DOWNSTREAM OF THE INTERSECTION OF THE SPUR WALL WITH THE MAIN LINE PIPE WALL. THE OPENING SHALL BE RECTANGULAR, CUT NORMAL TO PIPE SURFACE AND WITHOUT DAMAGING REINFORCING STEEL. IF A JOINT IN THE MAIN LINE PIPE FALLS WITHIN THE LIMITS OF THE CONCRETE CRADLE, PROVIDE A CONCRETE ENCASEMENT ONE FOOT ABOVE THE TOP OF THE MAIN LINE PIPE TO THE LIMITS OF THE CRADLE.
2. THE TRANSVERSE REINFORCEMENT IN PIPE SHALL BE CUT AT CENTER OF OPENING AND BENT INTO TOP AND BOTTOM SLABS OF SPUR.
3. CONCRETE STRENGTH SHALL BE 3,000 PSI AT 28 DAYS.

PLANS FOR CONSTRUCTION OF
FACILITY NO. LOOPOI
FROM ~~DEL OBISPO ST.~~ TO P.C.H.
DANA POINT HARBOR DRIVE

GENERAL NOTES

1. ALL WORK TO BE DEDICATED TO THE COUNTY OF ORANGE SHALL BE IN CONFORMANCE WITH THE DISTRICT'S STD. SPECS. WHICH MAY BE PURCHASED FROM THE DISTRICT AND SHALL BE KEPT ON THE JOB SITE AT ALL TIMES.
2. THE CONTRACTOR SHALL NOTIFY THE DISTRICT'S INSPECTOR AT LEAST 24 HOURS PRIOR TO COMMENCEMENT OF ANY CONSTRUCTION BY TELEPHONING 834-3410, OR BY WRITING THE ORANGE COUNTY FLOOD CONTROL DISTRICT, 400 WEST CIVIC CENTER DRIVE, SANTA ANA, CALIF.
3. ALL CONC. IN REINF. CONC. STRUCTURES SHALL BE 3000 POUNDS PER SQ. INCH. IN 28 DAYS, PORTLAND CEMENT CONC., CLASS A.
4. ALL PIPE LENGTHS ARE HORIZONTAL PROJECTIONS, UNLESS OTHERWISE SHOWN.
5. LOCATIONS OF PUBLIC UTILITIES SHOWN HAVE BEEN DETERMINED FROM AVAILABLE INFORMATION. HOWEVER IT SHALL BE THE RESPONSIBILITY OF THE CONTRACTOR TO DETERMINE THE TRUE LOCATION OF ANY EXITING UTILITIES AND TO EXERCISE PROPER PRECAUTIONS TO AVOID INJURY OR DAMAGE THERETO.
6. ALL FILL SHALL BE COMPACTED TO 90' RELATIVE COMPACTION AS DETERMINED BY THE CALIFORNIA TEST METHOD NO. 216-F1963 "FIVE LAYER METHOD" ALL BACKFILL MATERIAL SHALL BE FREE FROM VEGTABLE MATTER.
7. PIPE CONSTRUCTIONSHALL BE COORDINATED WITH THE GRADING WORK SO THAT WHEN THE FILL OPERATION HAS BEEN COMPLETED TO A GRADE A MIN. OF (4') FEET ABOVE THE TOP OF THE PIPE. THE STORM DRAIN TRENCH SHALL BE EXCAVATED AND THE PIPE INSTALLED.
8. ALL REINF. CONC. PIPE SHALL BE BEDDED IN ACCORDANCE WITH OCEMA, STD. PLAN 319.
9. REINFORCEMENT IN REIF. CONC. PIPE SHALL HAVE A MIN. CONC. COVER OF 1½" FROM INSIDE FACE OF PIPE WHERE NOTED ON PLANS.
10. ALL MATERIALS TESTING FOR THE STORM DRAIN FACILITIES AND RELATED CONSTRUCTION SHALL BE PROVIDED BY THE CONTRACTOR OR DEVELOPER IN ACCORDANCE WITH THE NUMBER, LOCATION AND FREQUENCY REQUESTED BY THE FLOOD CONTROL DISTRICT'S INSPECTOR
11. ALL SURVEYING REQUIRED FOR VERTICAL AND HORIZONTAL ALIGNMENT SHALL BE PROVIDED BY THE CONTRACTOR OR DEVELOPER AND SUFFICIENT REFERENCE STAKING SHALL BE IN ACCORDANCE WITH THE REQUEST OF THE DISTRICT'S INSPECTOR.
12. ALL PIPE JOINTS SHALL BE BANDED AND GROUTED.
13. A PERMIT FOR WORK WITHIN EXISTING OR PROPOSED STREET RIGHT OF WAY IS REQUIRED FROM THE ORANGE COUNTY ROAD DEP'T. FOR ANY ENCROACHMENT NECESSARY FOR CONSTRUCTION IN PUBLIC RIGHT OF WAY. STORM DRAIN BACKFILL FOR ALL FACILITIES WITHIN STREET RIGHT OF WAY IS TO BE PLACED AND COMPACTED UNDER ROAD DEP'T. INSPECTION, AND MEET OR EXCEED ROAD DEP'T. MINIMUM STANDARDS.

GENERAL NOTES: (CONTINUED)

14. THE CONTRACTOR SHALL NOTIFY THE ORANGE COUNTY ENVIRONMENTAL MANAGEMENT AGENCY, CONSTRUCTION DIVISION (834-3486) 48 HOURS PRIOR TO BEGINNING ANY WORK WITHIN DISTRICT'S RIGHT OF WAY.
15. THE CONTRACTOR SHALL CONDUCT CONSTRUCTION OPERATIONS IN SUCH A MANNER THAT STORM OR OTHER WATERS MAY PROCEED UNINTERRUPTED ALONG THEIR EXISTING STREET OR DRAINAGE COURSES.
16. IN THE COURSE OF WATER CONTROL, THE CONTRACTOR SHALL CONDUCT CONSTRUCTION OPERATIONS TO PROTECT WATERS FROM POLLUTION WITH FUELS, OILS, BITUMENS OR OTHER HARMFUL MATERIALS.
17. ALL CONSTRUCTION SHALL BE IN ACCORDANCE WITH O.C.E.M.A. STANDARD SPECIFICATIONS. (PUBLIC WORKS CONSTRUCTION, 1979 EDITION.)
18. CONTRACTOR SHALL PROVIDE FOR MATERIAL TESTING AT DIRECTION OF COUNTY ENGINEER.

APPROVED FOR MAIN LINE STORM DRAIN ONLY

PLAN

LOOPOI-713-3

STORM DRAIN AUXILIARY PUMP STATION, FOR FACILITY LOOPOI
SHEET 5 of 6 SHEETS

SD-025-05

EXHIBIT 4

1. STORM WATER PUMP STATION:

1.1 General: The Contractor shall furnish and install in the structure as described by specifications, and as shown in the plans, one factory-built automatic pumping unit as manufactured by the Flow Corporation, or equal. The principle items of the pumping unit shall include one submersible centrifugal sewage pump; motor control panel with fully magnetic type circuit breaker, magnetic motor starter, and automatic liquid level control system.

1.2 Pump:

a. The pump must have the necessary characteristics and be properly selected to pump unscreened storm water at design conditions as shown on the contract drawings. The pump/motor unit must be non-overloading across the complete head/capacity range of the pump.

b. The pump shall have a 4-inch discharge with 125 pound standard cast iron flange fitting.

c. All pump openings and passages shall be of adequate size to pass spheres 3 inches in diameter and any trash or stringy material which can pass through the storm drain.

d. The impeller shall be of cast iron, enclosed, and non-clog type shall be dynamically balanced.

e. Pump shall include impeller and suction cover wear rings. Impeller wear ring shall be of cast polymer material.

f. All exposed fasteners and lock washers shall be of 316 stainless steel.

g. The pump shaft shall be sealed against leakage by an oil-filled double mechanical seal. Both the stationary sealing member and mated rotating member shall be of tungsten-titanium carbide alloy.

1.3 Pump Motor:

a. The submersible pump motor shall be as called for on the contract drawings. The pump and motor furnished shall be an integral unit. Motor shall be suitable for Class 1, Division 1, Group D hazardous locations.

b. Motor frame and end shield shall be of corrosion-resistant cast iron with stainless steal hardware and shaft.

c. The oil filled seal chamber shall contain a moisture sensing probe through which signs of impending seal failure may be signalled to the motor control panel. This seal chamber shall also contain a labyrinth flame path slinger which serves as a protective slinger for the upper seal.

d. Motor shall have an internal pressure capability of 200 psi.

1.4 Quick Lift Assembly

a. General: Furnish one "quick lift" slide rail mechanism to guide submersible pump from 5 feet above the concrete base to its operational location in the sump base.

b. Elbow: The base elbow shall be cast in accordance with A.S.T.M. Specification No. A46-76, Class 30. All pipe flanges shall be faced and to the thickness required for compliance with 125 lb. American Standard. Bolt slots are acceptable in lieu of drilled holes. Bolt slots in the base are to be provided for mounting the elbow to the concrete floor or sole plate. The base elbow is specifically designed to permit the slide mechanism to link up the pump with the base elbow.

c. Rail: The guide rail is to be constructed from standard structural angle and anti-rust coated to prevent corrosion and maintain a smooth surface for the guide shoes. The guide rail is to be attached to the discharge pipe with pipe straps every 12" o/c,

d. Guide Shoes: Two teflon coated shoes are to guide the pump assembly down the guide rail until the shoes contact the discharge elbow.

The pump then fulcrums about this point and positions the pump discharge flange to properly engage it with the discharge elbow.

e. Jam Washer: A neoprene jam washer shall fit in the slide plate to minimize leakage between the pump casing and base elbow.

f. Slide: The pump discharge is to be bolted to the slide on one side and the guide shoes are to be attached to the other side. The slide is to be guided in its descent and ascent by the rail and guide shoes.

1.5 Lift Cable:

A ½ inch diameter stainless steel braided wire lift cable shall be permanently attached to the pump. Provision shall be made for attaching upper end of this cable to the wet well access frame.

1.6 Hardware:

All bolts, machine screws, nuts, washers, and lockwashers for complete assembly of access cover, guide rails, and discharge elbow shall be furnished by manufacturer in 316 stainless steel.

1.7 Control:

a. Enclosure: A NEMA type 4, UL listed, dead-front enclosure, key-lockable, shall house all control equipment. The panel shall be fully gasketed and dust tight and shall include test push buttons (one for each level control), and moisture sensing alarm system consisting of necessary relays and warning light. In the event of a seal failure alarm, the pump shall be shut down and remain inoperative until the seal is corrected. Circuit breaker , motor starter , reset buttons, and pump control H.O.A. switches shall be surface mounted for accessible operation without opening the high voltage panel. The low voltage pump control section shall be enclosed is a hinged section of the

panel and isolated from the high voltage section. All low voltage control wiring shall be accessible by a hinged drop shelf covering the control section. All external wiring shall terminate behind this panel. A grounding type convenience outlet shall be porvided for operation of 127 volt AC devices and shall be protected by a 15 amp thermal magnetic circuit breaker.

b. Circuit Breakers: Magnetic circuit breakers shall be provided for branch disconnect service and over-current protection against short circuits or grounds of motor branch circuit conductors, motor , controls and auxilliary equipment. Magnetic across-the-line starters with under voltage release and overload coils for each phase shall be provided for each pump motor to give positive protection against single phasing. All equipment control switches shall be labeled and a color coded wiring diagram shall be provided.

c. Level Controls: The automatic operation of the pump shall be controlled by wet well mounted electrodes as manufactured by Warrick Co., or equal. Electrodes shall be series 3W brass, with 32 1 A suspension wire, 32 1 B adaptors, 3 E 3B fitting. Series 2 low voltage control relays shall be included in the control panel.

d. Motor High Temperature Shutdown: The control shall be equipped with high temperature shutdown for motor and shall utilize the temperature switches embedded in the motor windings. In a high motor temperature condition, the switch shall open, de-energize the motor starter and stop the pump motor. The high motor temperature shutdown device shall be automatic reset.

e. Seal Failure Shutdown: The control panel shall be equipped with a moisture detector control for pump which senses moisture in the oil cavity should the lower seal fail. Sensor probes located in the oil cavity will detect the influx of moisture and disrupt the motor starter circuit of the particular pump involved. Should this condition occur, the pump motor shall remain inoperative until the problem is corrected and the control circuit has been manually reset.

1.8 Running Light :

Include in the motor control panel a pilot light for pump motor which shall illuminate red light when the motor is running.

1.9 Wiring:

a. The lift station shall be completely wired at the factory, except for the power feeder lines, in accordance with applicable wiring standards set forth by the National Electric Code (NEC). All wiring in the lift station shall be color coded and numbered as indicated on the wiring diagram.

b. All components shall be electrically grounded to a common ground lug mounted on the control panel sub plate. Upon installation of the lift station, and before connection of any power feeder lines, Contractor shall extend grounding wire from lug to external ground in accordance with local electrical code.

2.0 Operational Test:

The pump, motor and controls shall be given an operational test in accordance with the standards of the Hydraulic Institute. Recordings of the test shall substantiate the operation of equipment at the design head, capacity, speed and horsepower as herein specified.

2.1 Operation and Maintenance Manuals:

Contractor shall provide 4 sets hardbound manuals to include the following for each component:

a. Catalog
b. Parts list
c. Price list
d. Wiring diagram
e. Plan and details
f. Performance curves
g. Copies of operational test

19	342.62	25.35	1.601	0.20(0.07)	0.37	237.1	126.00

COMPUTED CONFLUENCE ESTIMATES ARE AS FOLLOWS:
PEAK FLOW RATE(CFS) = 408.41 Tc(MIN.) = 14.12
EFFECTIVE AREA(ACRES) = 190.59 AREA-AVERAGED Fm(INCH/HR) = 0.07
AREA-AVERAGED Fp(INCH/HR) = 0.20 AREA-AVERAGED Ap = 0.36
TOTAL AREA(ACRES) = 237.1
LONGEST FLOWPATH FROM NODE 112.00 TO NODE 209.00 = 9190.00 FEET.

==========

END OF STUDY SUMMARY:
TOTAL AREA(ACRES) = 237.1 TC(MIN.) = 14.12
EFFECTIVE AREA(ACRES) = 190.59 AREA-AVERAGED Fm(INCH/HR)= 0.07
AREA-AVERAGED Fp(INCH/HR) = 0.20 AREA-AVERAGED Ap = 0.360
PEAK FLOW RATE(CFS) = 408.41
